SPECIFICATION AMENDMENTS

Please amend paragraphs 18, 20, and 21 of the specification as follows.

[0018] The releasable connection 5 comprises at least one base plate 10 which is held in position on a component 3 and has at least one projecting pin 11, 11a, and a receiving device 12 which is fastened to the other component 4 and has an interior locally slotted sleeve part 13. An end-side profiled head section 14, 14a of the pin 11, 11a can be guided through openings ~~15, 16, 17~~ 15, 15a, 16, 16a, 17, 17a of the component 4, of the receiving device 12 and of the sleeve part 13. As a result of the radial rotation of the sleeve part 13 about an ~~angle~~ angle α, which, in this case, in areas, reaches behind a circular-arc-shaped area 18 of the head section 14, a fastening of the parts 10, 12 of the releasable connection takes place and, as a result, the ~~component~~ components 3, 4 are tensioned with respect to one another.

[0020] According to Figure 5, ~~two detent noses 21, each arranged in~~ pairs ~~21, are~~ of detent noses 21 are provided on the base plate 10, which detent noses lockingly interact with the component 3. The detent noses 21 extend on both sides of the injection-molded-on pins 11, 11a (Figure 5). On the side facing away from the pins 11, 11a, the base plate 10 has a longitudinally extending bent supporting rib 22 as well as several transversely extending supporting ribs 23.

[0021] Each molded-on pin 11, 11a is composed of a foot section 24, 24a, of a head section 14, 14a provided with reinforcing ribs 25, 25a and of a web region 26, 26a situated in-between. The pins 11, 11a, which are connected to the base plate 10 approximately at a right angle, viewed in the top view, extend at an ~~angle~~ □ angle β with respect to the contact surface 27 of the base plate 10 (see Figure 6). The two pins 11, 11a are constructed at a distance from one another on the elongated base plate 10. However, two separate base plates can also be used which each have a projecting pin 11.
